SES Wants to Hear 1960 Tsunami Recollections

The New South Wales SES is conducting research into the consequences of the 1960 tsunami in New South Wales to assist in its emergency management planning for tsunami.

To assist the SES in this undertaking, the SES is requesting members of the public with recollections of the tsunami to contact the SES on (02) 4251 6665 between the hours of 8:30am to 4:30pm weekdays.

The 1960 tsunami was caused by a large undersea earthquake off the coast of Chile. The tsunami impacted the New South Wales coastline on the 23rd and the 24th of May 1960. Examples of effects of the tsunami included abnormal ocean behaviour, strong currents in harbours and estuaries and localised coastal erosion and flooding.

Boats were pulled from their moorings, and in Newcastle harbour a coal carrier was sunk. At Balmain logs were swept from a barge into the harbour and the Bundeena Ferry was affected by strong currents. Along the coast seawater caused some flooding at the coast near Eden and at Batemans Bay where fishermen were trapped on rocks. At Clontarf in Sydney currents caused erosion of the foreshore.

According to SES Manager Planning Andrew Gissing, "The SES is very interested in the collection of information about previous tsunami impacts to inform current tsunami emergency planning initiatives being undertaken."
